

# COMPSCI 101 2021 S1 Principles of Programming

## Lecture 29 - Exam Revision

## 2021 S0 Exam

- ▶ Worth 40% of your final mark for CompSci 101
- ▶ No calculators
- ▶ 20 questions (all on CodeRunner)
  - ▶ Programming Questions (precheck & check)
  - ▶ Theory Questions:
    - ▶ MCQ/short answer questions: one check button click
    - ▶ Long answer questions: No feedback
    - ▶ Boolean expression: No feedback, no precheck/check button

Look over labs, assignments, code runner exercises, lecture exercises, the test.

L26

## Topics

- ▶ Bits and pieces: slicing lists, tuples and strings, evaluating an arithmetic expression, len(), min(), max(), round(), sum(), int(), float(), str(), input(), mutable objects, in, and, or, not, tuples, object types, passing objects as parameters,
- ▶ if ... elif ... else statements, while loops, for ... in range(...) and for ... in ... loops, range(start, end, step)
- ▶ Process a string, string methods: rfind(), find(), split(), manipulate and reassemble a string, slicing a string
- ▶ Some questions on lists, define a function which manipulates list objects
- ▶ Some questions on dictionaries, define a function which creates a dictionary, and prints the dictionary
- ▶ Some questions on tuples, define a function which manipulates tuples
- ▶ Read text from a text file, process the text information, return result

3

L26

## Exercise 1: String manipulation

- ▶ Write a function called **print\_title(word)** which takes a string as a parameter and prints the word in a series of lines. Each line of the word is shortened by removing the first and the last character until the word contains no more characters. The left indent is made up of an increasing number of '-' characters. The characters of the word are all in uppercase characters.

- ▶ `print_title('marvellous')`

```
MARVELLOUS
-ARVELLOU
--RVELLO
---VELL
----EL
```

- ▶ `print_title('fantastic')`

```
FANTASTIC
-ANTASTI
--NTAST
---TAS
----A
```

4

L26

## Algorithm

### ▶ Parameter: word

- ▶ marvellous
- ▶ Length of the word: 10
- ▶ Number of rows = **5**
- ▶ 1<sup>st</sup> row: zero '-'
- ▶ 2<sup>nd</sup> row: 1 \* '-' and 8 letters, index: 1 to 9 (i.e. 10-1)
- ▶ 3<sup>rd</sup> row: 2 \* '-' and 6 letters, index: 2 to 8 (i.e. 10-2)
- ▶ 4<sup>th</sup> row: 3 \* '-' and 4 letters, index: 3 to 7 (i.e. 10-3)
- ▶ 5<sup>th</sup> row: 4 \* '-' and 2 letters

```
MARVELLOUS
-ARVELLOU
--RVELLO
---VELL
----EL
```

Length of the word: 9

Number of rows = **5**

```
1st row: zero '-'
2nd row: 1 '-' and 7 letters
3rd row: 2 '-' and 5 letters
4th row: 3 '-' and 3 letters
5th row: 4 '-' and 1 letter
```

```
FANTASTIC
-ANTASTI
--NTAST
---TAS
----A
```

5

L26

## Exercise 2: Python Lists

- ▶ Complete the `convert_first_letter()` function which is passed a list of names as a parameter. The function **changes** the first letter of each name in the list to uppercase, leaving the rest of the name unchanged. You can assume that each element of the list contains at least one character.

```
names: ['karl', 'Orlando', 'carlo', 'zAC']
['Karl', 'Orlando', 'Carlo', 'ZAC']
```

- ▶ Common mistake: for-each loop

- ▶ <- DO NOT USE (when you want to change values in a list)

```
for word in names_list:
    word = word[0].upper() + word[1:]
```

6

L26

## Exercise 3: Python Lists

- ▶ Write a function called `sum_over(a_list_of_lists, target)` which takes a list of integer lists and an integer as parameters, and returns the sum of all entries in the parameter list of lists which are **greater than** a specified amount, target.

```
the_list = [[2, 4, 16, 80, 27], [1, 4, 120, 18, 7],
            [20, 14, 70, 8, 130]]
print(sum_over(the_list, 50))
```

```
400
(i.e. 80 + 120 + 70 + 130)
```

```
print(sum_over(the_list, 100))
```

```
250
(i.e. 120 + 130)
```

7

L26

## Algorithm

- ▶ Parameter: list\_of\_lists

```
result = 0
```

```
for each list in the list of lists
```

```
for each item in the list
```

```
if item is bigger than the target
```

```
Add item to the result
```

8

L26

## Exercise 4: Python Tuples -

- Write a function called `get_left_most_x(points)` which takes a list of tuples as a parameter and returns the smallest left-most position of any tuple in the list. You can assume that
  - every tuple in of the list contains more than one element
  - the size of the list is at least one, and
  - Values are all  $\geq 0$

```
points = [(100,5), (20, 100), (140, 200), (70, 100), (25, 0)]
print("Smallest x value:", get_left_most_x(points))
```

### Steps:

- Set a min value
- for each tuple in the list of tuples

Smallest x value: 20

## Exercise 5: Python dictionaries

- Complete the `merge(dict1, dict2)` function which is passed two dict objects as parameters, dict1 and dict2. Both parameter dictionaries have a single character as the keys and a list of integers as the corresponding values.
  - The function looks at the lists corresponding to the **same** key in both dictionaries.
    - For any key which is the same in both dictionaries, then any integer in the corresponding list of dict2 which is **not** already in the corresponding list of dict1 is added to the dict1 corresponding list. All the corresponding lists of dict1 are kept in sorted order.

```
dict1 = {"A": [1, 2, 3, 5], "B": [1, 2, 8], "X": [0, 9], "N": [8]}
```

```
dict2 = {"A": [5], "B": [2, 4, 7], "T": [5, 6], "N": [3, 8]}
```

```
A : [1, 2, 3, 5]
B : [1, 2, 4, 7, 8]
N : [3, 8]
X : [0, 9]
```

## Algorithm

```
dict1 = {"A": [1, 2, 3, 5], "B": [1, 2, 8], "X": [0, 9], "N": [8]}
```

```
dict2 = {"A": [5], "B": [2, 4, 7], "T": [5, 6], "N": [3, 8]}
```

- Parameters: dict1, dict2

For key1 and list1 in dict1

- if key1 exists in dict2
  - Get the corresponding list from dict2
  - For all values in the list
    - If it is not exists in the list from dict1
      - append it to list1

Sort all values in the list1

## Exercise 6: File Reading

- Complete the `get_lines_from_file(filename)` function. This function takes a filename as a parameter, open and reads the contents of the file specified in the parameter. This file contains several webpages and links. The file contents should then be converted into a list of strings.

### Input:

```
home:news
home:calendar
home:enrolments
our_people:staff
...
```

```
['home:news', 'home:calendar',
'home:enrolments', ...]
```

## Exercise 7: Print pyramid

- ▶ Write a function called `print_pyramid(number)` to produce a triangle of empty spaces surrounded by "+"s.

- ▶ If the parameter is 4, the function should produce:

```
+++++++  
++++ ++  
+++  ++  
++   ++  
+    +  
+++++
```

- ▶ If the parameter is 1, the method should produce:

```
+++  
+ +  
+++
```
